Carboxylic acids

Contains a *carboxyl group*, which is a carbonyl group (C=O) attached to a hydroxyl group (-OH). Has the carboxyl group on carbon 1. carbonyl group.

Structure of Carboxylic Acids

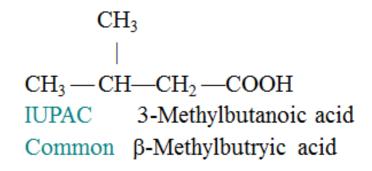

The functional group of a carboxylic acid is a carboxyl group.

- * The general formula of an aliphatic carboxylic acid is RCOOH.
- * For an aromatic carboxylic acid, the general formula is ArCOOH.
- Identify longest chain containing the carboxyl group

Nomenclature

- (IUPAC) Number carboxyl carbon as 1
- $\ \ \, \ \ \,$ (Common) Assign $\alpha,\,\beta,\,g,\,\delta$ to $\ \,$ carbon atoms adjacent to carboxyl carbon

١

The IUPAC system

- ❖ In the IUPAC system, carboxylic acids are identified by a suffix added to the parent name of the longest chain with different end being used depending on whether the carboxyl group is bonded to a chain or a ring.
- ❖ If the COOH is bonded to a chain, find the longest chain containing the COOH, and change the "e" end of the parent alkane to the suffix "oic acid".
- ❖ If the COOH is bonded to a ring, name the ring and add the words "carboxylic acid".
- \diamond Number the carbon chain or ring to put the COOH group at C_1 , but omit this number from the name.
- * Apply all the other usually rules of nomenclature.

Naming Carboxylic Acids

Formula	IUPAC	Common	
	alkan -oic acid	prefix – ic acid	
НСООН	methanoic acid	formic acid	
CH ₃ COOH	ethanoic acid	acetic acid	
CH ₃ CH ₂ COOH	propanoic acid	propionic acid	
CH ₃ CH ₂ CH ₂ COOH	butanoic acid	butyric acid	

Length of Carbon Chain	Structural Formula	Common Name ^a	IUPAC Name
C ₁ monoacid	Н—СООН	formic acid	methanoic acid
C ₂ monoacid	CH ₃ —COOH	acetic acid	ethanoic acid
C ₃ monoacid	CH ₃ —CH ₂ —COOH	propionic acid	propanoic acid
C ₄ monoacid	CH_3 — $(CH_2)_2$ — $COOH$	butyric acid	butanoic acid
C ₅ monoacid	CH_3 — $(CH_2)_3$ — $COOH$	valeric acid	pentanoic acid
C ₆ monoacid	CH_3 — $(CH_2)_4$ — $COOH$	caproic acid	hexanoic acid

^a The mnemonic "Frogs are polite, being very courteous" is helpful in remembering, in order, the first letters of the common names of these six simple saturated monocarboxylic acids.

 $\begin{array}{c} & \text{Br} \\ | \\ \text{CH}_{3}\text{CH}_{2}\text{CHCOOH} \end{array}$

CH₃ CH₃CHCH₂COOH

α-Bromovaleric acid

β-Methylbutyric acid
Isovaleric acid

Br HOOCCH₂CHCH₂CH₂COOH

3-bromohexandioic acid β-bromoadipic acid

HOOC-COOH oxalic acid

HO₂C-CH₂-CO₂H malonic acid

HO₂C-CH₂CH₂-CO₂H succinic acid

HO₂C-CH₂CH₂CH₂-CO₂H glutaric acid

HOOC-(CH₂)₄ -COOH adipic acid

HOOC-(CH₂)₆-COOH pimelic acid

Carboxylic acids: Structure and physical properties

The carboxyl group consists of two very polar functional group, the carbonyl group and the hydroxyl group. Thus, carboxylic acids are very polar compounds. In addition, carboxylic acids can hydrogen bond to one another. As a result, they boil at higher temperatures than aldehydes, ketones, or even alcohols of comparable molecular weight. Carboxylic acids can form intermolecular hydrogen bonds with water molecules. Are high because they form dimers in which hydrogen bonds form between the polar groups in the two carboxyl groups.

Comparing Physical Properties

Boiling Point:

Carboxylic acid Alcohols Aldehydes/Ketones Ethers Alkanes

Water Solubility:

Carboxylic acid Alcohols Aldehydes/Ketones Ethers Alkanes

Name	Molecular weight	Boiling point	Solubility in water
Pentane	72 g/mol	35°C	Insoluble
Diethyl ether	74 g/mol	35°C	Insoluble
Butanal	72 g/mol	76°C	$7.1~\mathrm{g}$ / $100~\mathrm{mL}~\mathrm{H}_2\mathrm{O}$
1-Butanol	74 g/mol	118°C	$9.1~{ m g}/100~{ m mL~H_2O}$
Propanoic acid	74 g/mol	141°C	Infinite

Example

Which member of each of the following sets of compounds has the highest boiling point?

- 1. Ethane or ethanol or ethanoic acid.
- 2. propanal or propanone or 1- propanol
- 3. methanal or methanol or methanoic acid

Answer

The boiling points of most alkanes, alcohols, aldehydes and carboxylic acids that have similar molecular weights obey the following relationship:

Alkane < aldehyde or ketone < alcohol < carboxylic acid

lowest highest

ethanoic acid 2. 1- propanol 3. methanoic acid

Examples: Predicting Physical Properties

- · Arrange the following compounds in order of increasing boiling point. (All of the compounds have about the same molecular weight.)
 - 1-pentanol
 - hexane
 - butanoic acid
 - pentanal
- Which member of each of the following pairs of compounds would you expect to have a higher solubility in water?
 - 2-butanone or propanoic acid
 - hexanoic acid or ethanoic acid

Preparation of Carboxylic Acids

1. oxidation of primary alcohols

2. oxidation of arenes

ArR + KMnO₄, heat
$$\rightarrow$$
 ArCOOH
 $CH_3CH_2CH_2CH_2OH + K_2Cr_2O_7$ \longrightarrow $CH_3CH_2CH_2COOH$
N-buty alcohol Butyric acid
1- Butanol Butanoic acid

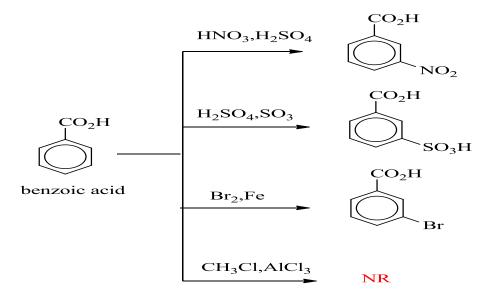

Isobutyl alcohol 2-Methyl-1-propanol

Isobutyric acid

toluene

benzoic acid

terephthalic acid p-xylene

Write the equation for the reaction of propanoic acid with

A. water

B. KOH

Write the equation for the reaction of propanoic acid with

A. water

$$CH_3$$
- CH_2 - $COOH + H_2O \longleftrightarrow CH_3$ - CH_2 - $COO^- + H_3O^+$
B. KOH

Derivatives of carboxylic acids:

1- Esters

- The functional group of an ester is an acyl group bonded to -OR or -OAr.
- Name the alkyl or aryl group bonded to oxygen followed by the name of the acid.

٦

Change the suffix -ic acid to -ate.

O
$$H_2$$
C H_2 C

$$R-C-OH + PCl_5 \longrightarrow R-C-Cl$$

$$R-C-Cl + ROH \longrightarrow R-C-OR + H_2O$$

2- Amides

- The functional group of an amide is an acyl group bonded to a nitrogen atom.
- drop -oic acid from the name of the parent acid and add -amide. (For the common acid name, drop -ic of the acid name and add -amide.)
- \diamond an alkyl or aryl group bonded to the N: name the group and show its location on nitrogen by N-.

$$R - C - OH + PCl_3 \longrightarrow R - C - Cl$$
 $RCOCl + NH_3 \longrightarrow RCONH_2$
 $CH_3CH_2COCl + CH_3NH_2 \longrightarrow CH_3CH_2CO-NH-CH_3$

3- Anhydrides

- * Two acyl groups bonded to an oxygen atom.
- The anhydride may be symmetrical (two identical acyl groups) or mixed (two different acyl groups).
- To name, replace acid of the parent acid by anhydride.

O O
$$CH_3 - \overset{1}{C} - O - \overset{1}{C} - CH_3$$

Acetic anhydride

Preparation of anhydrides:

Heat promotes a **condensation reaction** between two carboxylic acid groups

Preparation of mixed anhydrides

$$R^{1}-C = R^{1}-C = R^{1$$

Example

The following general formulas are used to represent different classes of organic compounds. Name each of the appropriate families.

- 1. ROH
- 4. ROR
- 2. RCHO
- 5. RCOOH
- 3. RCOR
- 6. RCOOR

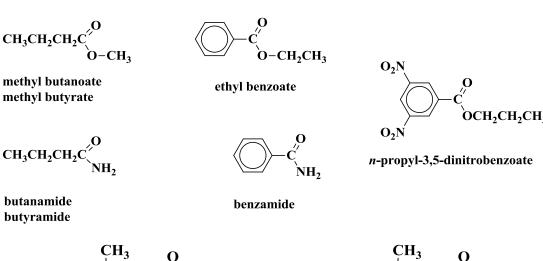

Answer

- 1. Alcohol
- 4. Ether
- 2. Aldehyde
- 5. Carboxylic acid
- 3. Ketone
- 6. Ester

Acidic Reaction with H₂O - Amides

2-Phenylbutanamide

2-Phenylbutanoic acid

$$\begin{array}{cccc} \text{CH}_3 & \text{O} & \text{CH}_3 & \text{O} \\ \text{CH}_3\text{CHCH}_2\text{C} & \text{CH}_3\text{CHCH}_2\text{C} & \text{OH} \end{array}$$

isovaleramide

isovaleric acid
